

Supporting Bring Your Own Device (BYOD)

NetSupport School is used daily across the world for classroom instruction, monitoring, collaboration and assessment – engaging students via technology-enhanced learning.

Many schools are increasingly operating Bring Your Own Device policies where students can bring their own tablets, phones or laptops into the classroom to use for study purposes.

As a fully future-proofed solution, NetSupport School offers versions for all leading desktop and mobile platforms including:

Windows

macOS

Chrome OS

Android

iOS

These multi-platform credentials mean it is flexible enough to support a school's BYOD policy, so no matter how you intend to deliver your BYOD methodology, NetSupport School has you covered.

Connecting to students

Once configured, teachers can easily connect to their students' devices either via one of NetSupport School's several easy connection methods or, alternatively, they can use their school's existing Student Information System (SIS) – meaning that teaching time is maximised and students' engagement with the lesson is enhanced by using their own device.
