

College Place Public Schools Dennis DeBroeck, Educational Technology

How is the software currently being used in your organization?

We use the software to monitor student activity and allow personalized instruction, depending on need. Students are encouraged through interaction and are kept on task by the same process. This can often be done by a message sent directly to the individual student. It is discreet and instantaneous. You will see the smile on a student's face when you send a message that compliments good work. Of course, you'll see a change in activity if a student is off task and they get a different message! No other student in the class knows when this happens, so it is a way to manage and target specific activities (both positive and negative) by students with no disruption to the others.

The challenges we were trying to solve:

Our main challenges were management of our classroom technology and user support management.

Why did you choose NetSupport School?

We chose NetSupport School because I has used it in a school district where I worked previously. Student screens can be blacked out while instruction is taking place and attention is needed. On the other side, you can broadcast the activity for the day on all screens for more detail and attention.

The features seem endless to enable different classroom scenarios and needs, depending on the subject and teaching style. It is a must for application labs and any classroom that has student computers to monitor.

How/where has NetSupport added value?

NetSupport School is flxible and easy to use, has increased productivity and performance in our school and saves us time. There are numerous usable features, great support, and very affordable.

We would recommend NetSupport to others.
